1. Abstract

The Byzanlink Token, **BYZAN**, is the coordination asset of the Byzanlink ecosystem. It is designed to align governance, liquidity, and long-term participation across tokenised financial products and onchain capital markets.

As Byzanlink brings structured, yield-bearing financial products onchain, BYZAN serves as the mechanism through which participants engage with the protocol, support ecosystem growth, and contribute to the long-term development of the network. Its design connects real-world financial activity with programmable onchain incentives, creating a token model centered on utility, alignment, and disciplined expansion.

BYZAN is built around a fixed-supply framework, long-term vesting, and targeted incentive programs rather than perpetual inflation. The objective is to support an institutional-grade financial network where participation is tied to productive ecosystem activity, governance evolves progressively over time, and value is shaped by the growth of real tokenised financial products.

2. Token Supply

Fixed Supply Model

- Total Supply: 1,000,000,000 BYZAN
- Minting: No additional tokens will be created after TGE
- Inflation: None by default

This fixed-supply structure is intended to provide predictability, scarcity, and long-term alignment. BYZAN is not designed around ongoing dilution. Instead, it is structured to support disciplined ecosystem growth while preserving supply integrity over time.

3. Token Distribution

Category	Allocation	Token Amount	Unlock at TGE	Release / Vesting Schedule (Months)	Cliff (Months)
Strategic Investors	10%	100,000,000	0%	24	12
Public Launch & Distribution	7.00%	70,000,000	20% of the category	12	0
Core Contributors & Strategic Advisors	20%	200,000,000	0%	33	15
Ecosystem & Community Incentives	31.00%	310,000,000	4% of the category	48	0
Foundation & Protocol Growth	25.00%	250,000,000	0%	48 (from month 1)	0
Liquidity & Market Operations	7.00%	70,000,000	40% of the category	3	0

The distribution is designed to balance long-term ecosystem development, contributor alignment, strategic backing, liquidity support, public market entry, and protocol growth.

4. Vesting & Unlocks

The vesting framework is designed to align major stakeholder groups with the long-term development of the Byzanlink ecosystem while limiting near-term supply pressure following TGE.

Byzanlink applies differentiated vesting schedules based on the role each allocation plays in network formation, market activation, and ecosystem growth.

4.1 Long-Term Aligned Stakeholders: These allocations are structured with longer cliffs and vesting periods to reinforce long-term commitment and reduce early unlock pressure.

- **Strategic Investors:** 0% unlocked at TGE, followed by a 12-month cliff and 24-month linear vesting. This category comprises pre-seed and strategic investors participating before TGE.
- **Core Contributors & Strategic Advisors:** 0% unlocked at TGE, followed by a 15-month cliff and 33-month linear vesting, fully vesting at month 48. Core team, contributors, and advisors are deliberately subject to a longer cliff than investors, reinforcing that those building the network are the last to unlock.

4.2 Network Launch & Market Activation: These allocations support launch readiness, early distribution, and market formation.

- **Public Launch & Distribution:** 20% of tokens actually allocated will unlock at TGE, with the remaining allocation vesting linearly over 12 months following a 0-month cliff. This category funds the public sale, launchpad distribution, and community distribution initiatives, executed at uniform terms across all platforms.

- **Liquidity & Market Operations:** 40% of the category available at TGE, with the remainder vesting over 3 months to support listing readiness across CEX and DEX venues, market depth, and trading stability across launch venues in the early post-launch phase.

4.3 Ecosystem Development & Protocol Growth

These allocations are paced over longer time horizons to support ecosystem expansion and protocol-level initiatives.

- **Ecosystem & Community Incentives:** 4.00% of the category unlocked at TGE, with the remainder distributed programmatically over 48 months through Byzanlink Pulse rewards, staking incentives, RWA Markets participation programs, grants, and ecosystem growth initiatives. Pulse rewards are paid in vested BYZAN with 6–12 month schedules, weighted toward participation duration and retention.
- **Foundation & Protocol Growth:** 0% unlocked at TGE, with linear release from month 1 through month 48. Released tokens accumulate in labeled Foundation wallets and may be converted only under the disclosed Foundation & Protocol Growth Policy set out in Section 9. Release does not imply sale.

Schedule Integrity

The allocation and vesting parameters set out in this document represent the finalized tokenomics framework. Final parameters are confirmed at TGE, after which the vesting schedules for Strategic Investors and Core Contributors & Strategic Advisors are fixed and are not subject to extension, acceleration, or amendment. Programmatic pacing within the Ecosystem & Community Incentives allocation may be adjusted through governance and is reported quarterly. Any changes to allocation or vesting parameters prior to TGE will be disclosed.

5. Indicative Unlocked Supply at TGE

The initial unlocked supply at TGE is intended to be limited to the allocations necessary for market formation, public distribution, liquidity support, and controlled ecosystem activation.

TGE Unlock Source:

TGE Unlock Source	Calculation	% of Total Supply
Public Launch & Distribution	7.00% × 20%	1.40%
Ecosystem & Community Incentives	31.00% × 4%	1.24%
Liquidity & Market Operations	7.00% × 40%	2.80%
Estimated total unlocked at TGE		5.44%

Note: **Public Launch unlocks are subject to the amount actually allocated during presale.*

Maximum indicative unlocked supply at TGE: up to 54,400,000 BYZAN, representing up to 5.44% of total supply.

Byzanlink distinguishes between unlocked supply and free-float supply. A substantial portion of TGE-unlocked tokens including market-making inventory and DEX liquidity within Liquidity & Market Operations, and undistributed activation supply within Ecosystem & Community Incentives remains under Foundation control and does not constitute uncontrolled circulating supply. All Foundation, ecosystem, liquidity, and market-maker loan wallets are labeled and published at TGE, making this distinction verifiable onchain.

This reflects a highly disciplined initial float, helping minimize early sell pressure while still providing sufficient supply for launch operations, liquidity support, and ecosystem activation.

The chart presents the maximum indicative unlock schedule. Programmatic Ecosystem distributions may occur below the illustrated ceiling, and unused amounts remain within the reserve.

6. Utility of BYZAN

BYZAN is intended to serve as the primary coordination asset within the Byzanlink ecosystem.

I. Governance

BYZAN holders can participate in governance across key areas of the protocol, including:

- Treasury allocation
- Ecosystem incentive pacing
- Staking and reward frameworks
- New vault and product integrations
- Strategic growth initiatives

II. Staking & Alignment

BYZAN holders can stake tokens to receive stBYZAN, which represents staked participation in the network and may serve as the base asset for governance weight and eligible reward participation.

Staking is designed to:

- Support long-term alignment
- Strengthen token-holder retention
- Deepen governance participation
- Create an aligned base of long-term participants across the ecosystem

III. Rewards Program

BYZAN supports ecosystem-wide reward programs designed to encourage productive participation and long-term alignment.

The primary activation framework is the Byzanlink Pulse Rewards Program, which is intended to:

- Attract productive liquidity
- Support early participation across Byzanlink products
- Encourage longer-duration capital alignment
- Reward meaningful ecosystem engagement

Byzanlink Pulse is designed to be targeted and programmatic rather than perpetual. Its purpose is to support early network formation and deepen aligned participation across the ecosystem.

Users participating in eligible Byzanlink products may accumulate Byzanlink Pulse Points based on deposit amount, participation duration, and commitment level. Rewards are distributed proportionally based on program-specific allocation frameworks.

IV. Ecosystem Incentives

BYZAN can be used to support:

- Byzanlink Pulse rewards
- Staking rewards
- Liquidity and participation support programs
- Ecosystem-wide strategic initiatives

V. Access Layer Utility

BYZAN can also support:

- Priority access to selected vaults or launches
- Enhanced participation tiers
- Ecosystem-level benefits for aligned participants and institutions

BYZAN is designed to remain focused and coherent. Its role is to coordinate governance, incentives, participation, and access across the Byzanlink ecosystem.

7. Governance

Byzanlink is expected to begin with controlled governance and expand progressively over time as the network matures. This allows governance participation to grow in parallel with ecosystem depth, product adoption, and token-holder alignment.

The goal is to ensure governance evolves in a measured way, consistent with the maturity of the ecosystem and the long-term interests of aligned participants.

8. Ecosystem & Community Incentive Policy

The 31% Ecosystem & Community Incentives allocation is a long-term program reserve intended to support Byzanlink Pulse, staking, RWA Markets participation, grants, integrations and broader ecosystem growth.

Tokens will be distributed programmatically over 48 months based on approved initiatives, adoption and ecosystem requirements. Unused allocations remain within the reserve and are not automatically distributed.

Byzanlink Pulse is designed to reward productive and sustained participation rather than artificial transaction volume. Reward eligibility may consider factors such as net participation, duration, retention, ecosystem contribution and BYZAN alignment. Rewards may be subject to vesting, staking or other conditions intended to encourage long-term participation.

9. Foundation & Protocol Growth Policy

The 25% Foundation & Protocol Growth allocation supports protocol development, operations, governance, strategic expansion, regulatory initiatives, ecosystem programs and long-term financial sustainability.

The allocation releases gradually over 48 months. Tokens released to the Foundation are not automatically considered circulating and may remain held in Foundation-controlled reserves until required.

Any material deployment or monetisation of Foundation tokens will follow approved governance and treasury procedures, with appropriate controls, disclosures and reporting. Tokens transferred to partners, service providers or other recipients may be subject to separate vesting or usage restrictions.

10. Liquidity & Market Operations Policy

The 7% Liquidity & Market Operations allocation supports exchange listings, CEX and DEX liquidity, market-making arrangements, cross-chain liquidity and other market-development requirements.

40% of the category may be deployed at TGE. The remaining 60% vests linearly over three months and may be deployed progressively based on actual listing, liquidity and market-expansion needs.

Market-maker inventory should, where commercially feasible, be provided through time-limited and returnable token-loan arrangements. Liquidity, exchange and market-making allocations will be managed separately and subject to appropriate counterparty, reporting and reconciliation controls

11. Value Accrual Framework

BYZAN is designed not only as a utility and governance token, but also as a coordination asset that may benefit from the expansion of the Byzanlink ecosystem over time.

Revenue-Linked Buyback Commitment

Once Byzanlink RWA Markets reach sustained protocol revenue, as assessed on a trailing basis and ratified by governance, the Foundation will allocate a defined portion of ongoing protocol fee revenue to BYZAN buybacks, executed via pre-announced TWAP from labeled wallets and reported in the Quarterly Treasury & Float Report. Accrued buyback capacity may be reserved and concentrated within a defined post-TGE window. Purchased tokens are transferred to the Ecosystem & Community Incentives allocation subject to its programmatic vesting, or burned, as ratified by governance. Specific activation thresholds and allocation parameters are established and disclosed through governance once protocol revenue is established.

In addition, a portion of protocol revenue may be allocated, subject to governance, toward:

- Staking reward support
- Ecosystem reserve replenishment
- Strategic market support initiatives

Why this matters

This approach supports a stronger long-term foundation than relying on perpetual token issuance. Because the buyback commitment is triggered by verifiable protocol revenue and executed through disclosed mechanisms, token support increasingly reflects productive ecosystem activity and network growth rather than discretionary intervention.

The goal is to align token participation with real product expansion, real usage, and long-term financial sustainability.

Conclusion

BYZAN is the coordination layer of the Byzanlink ecosystem, aligning governance, incentives, liquidity, and long-term participation within a fixed-supply framework.

With controlled circulation, long-term vesting, targeted incentives, and potential value accrual through protocol activity, BYZAN is structured to support sustainable ecosystem expansion without relying on perpetual emissions.

As Byzanlink grows, BYZAN is intended to serve as the mechanism through which participants coordinate and contribute to the development of institutional-grade onchain capital markets.
